The full service is not yet live, but Google is testing the speeds. The company is providing affected subscribers with a temporary broadband connection. Google claims that testing the service "is a technical milestone on our journey, and we're excited to provide the network to a small group of customers who have signed up to receive service before the official public beta launch in mid-September." The service will reportedly be completely

live in a few months. Unlike many similar services, Google's new fiber-to-the-home service is offering a full gigabit service, at one gigabit per second, instead of offering speeds with "up to" a gigabit per second. Other providers typically offer speeds with "up to" a gigabit per second, meaning that the service provides a gigabit per second to customers but that the actual service may be slower. While there is no publicly stated pricing, Ars Technica reports that Google's previous gigabit service was offered at about \$70 per month, while Google Fiber currently offers 50-megabit broadband for \$70 per month and 100-megabit broadband for \$80 per month. The service is being offered to subscribers through an application created by Google, which has been called "Google Fiber Express." Google's announcement did not say when or if the company would release the "beta" to the general public. The full service is scheduled to launch in mid-September. FCC Chairman Tom Wheeler has indicated that he hopes that gigabit-per-second Internet access will be available by 2020, although the full service does not appear to be ready for use yet.

Efficient crystallization of collagen II, and its amorphous precursor, via submicellar or nanosized aggregates of surfactants. The efficiency of submicellar and nanosized aggregates of cationic surfactants in the crystallization of collagen II and its amorphous precursor was studied. The kinetics and crystal structure of the solid phases formed during the phase transitions of the protein-surfactant
