## RCRM

With the Radeon Custom Resolution Manager you can easily create and edit many different custom resolutions, directly from the desktop interface. These resolutions should always match the aspect ratio of your monitor. By pressing the "Create New Resolution" you can set the custom resolution directly from the desktop interface with a single click. You are saved the time to search for a list of possible custom resolutions in the operating system menu. After selecting the custom resolution you can change its scaling (from desktop to window) in the "Settings" dialog. Select the appropriate values. By applying the new resolution you can immediately see the result on your desktop, during the ongoing session. You can save custom resolutions as presets. On the "Presets" dialog you can select your

---

desired resolutions. On the "Save Current Settings" you can save the current custom resolution as a "Preset". This will save the aspect ratio and resolution selection of the current custom resolution. On the "Load Preset" dialog you can select a saved custom resolution. Your custom resolutions can be saved to a file (or URL). On the "Save Custom Resolutions" you can write custom resolutions to a file (or URL) and on the "Load Custom Resolutions" dialog you can read custom resolutions saved to a file (or URL). When you save your custom resolutions you can assign them a name. You can also assign any tags to the custom resolutions, which will help you to find the custom resolution later in the future. You can easily show the custom resolutions (with their scaling selected). On the "Custom Resolutions" dialog you can select whether to show the custom resolutions or not. Also note:

If you are on Windows 8.1 and have a high-end GPU (Radeon R9 and higher) for video/games performance, you should use the "Radeon Pro" version of this application.

## RCRM With Registration Code

In the gaming world, component ratios are those that are special and, as such, require special care. For example, if you have a CRT screen and want to improve its performance, the chances are that you're going to reduce its aspect ratio to get a bigger window in which to place your enemies. In terms of the CPU, the problem is similar, except that in the case of the AMD model, the screen can't be increased, so it has to be reduced. Why? Because resolution is measured in dots per inch, or DPI, and the maximum resolution supported by the motherboard is fixed. The problem is exacerbated by the fact that in many cases, the best settings are not available on the motherboard for whatever reason, yet still there is no way to select them on the fly, and actually determine their effect on image

---

quality. Even though all AMD Radeon owners should use Radeon Settings to set the best possible clock rates for their GPU, getting the optimal resolution for their CRT is still a problem. You have the right screen size, the exact aspect ratio, the best clock rates, and yet you end up with the right resolution either set manually or determined by the OS, rather than actually being what you want. Resolution is also a very important factor with regard to image quality. If the monitor is at the same size as the video card, you can set a higher resolution, and thus the settings are 'lifted up'. If you look at desktop resolutions when you install Windows XP, you see resolutions that match the screen size of the video card. AMD owners can also benefit from this. If you use a CRT, Catalyst should support the highest resolution possible, and it's something which is not necessarily guaranteed. To sum it up, a problem which constantly arises is that your

---

video card is probably the right size for the given display, yet the monitor you're using isn't a good fit for its native resolution. You should therefore use something like AMD Radeon Custom Resolution Manager to determine the best settings manually. That way, you get the best possible resolution for both monitor and video card, and you won't need to keep tweaking Catalyst every time Windows XP or Vista is updated. Plus, you can also use RCRM when you set up a new system. The program supports all AMD Radeon owners, and it is available as a free download. In the case of gaming systems, you

#### **What's New in the RCRM?**

For the past decade, AMD has made NVIDIA its major competitor in the workstation market and desktop processors for the leading gaming graphics. This is the reason that the

---

driver team has opted not to go back and do the same for OS X. In fact, ATI used to take precedence for Mac OS but as they have given up that claim, NVIDIA is now responsible for OS X graphics. The issue with creating custom settings for NVIDIA GPUs is that not a lot of people are running their entire OS X setup on NVIDIA hardware and it would be easy for someone to completely overlook a setting. This is the main idea behind Radeon Custom Resolution Manager. Instead of fighting through a bunch of convoluted options, you can click to apply custom adjustments for the display. This is a pretty big point. If you have to deal with a bunch of settings, you are not going to be too happy when you realize that you have to click through a huge set of options to get to the one you want. The Radeon Custom Resolution Manager is not a full-featured graphics driver in the way that Catalyst Control Center is.

---

This is for two main reasons. One is that Catalyst is the official driver (from AMD), while the RCRM is not. This of course leads to the other reason which is that, well, you are going to need a graphics driver to effectively program a custom resolution. Still, the RCRM tool allows for a little bit of flexibility when adjusting the display settings. As a matter of fact, you can see for yourself the differences that come with this app. RCRM Features: View and monitor resolution, easily change resolution settings and format. Preview and monitor display activity. Adjust screen brightness and monitor contrast. Test monitor with a number of resolution, check how GPU scaling is on. Specify preferred display mode. Monitor if OS is properly installed with needed drivers. Check GPU hardware. Change screen settings permanently. Built in Tray to detect when system is booted to increase user experience.
